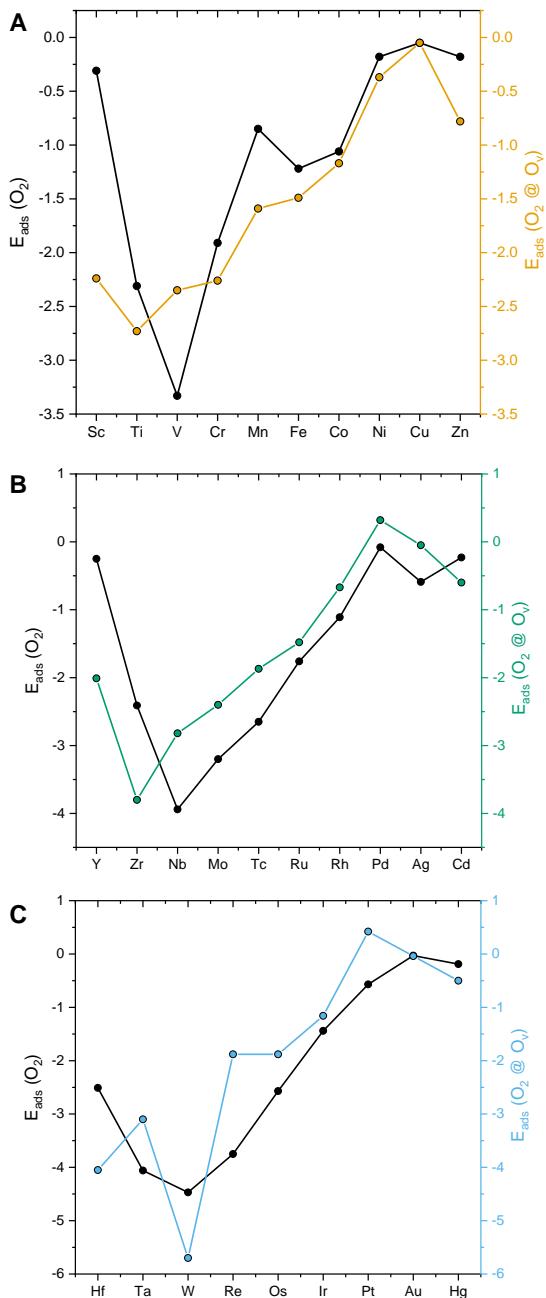

**Figure S25.** DFT calculations on Rh<sub>1</sub>/CsPMA. Calculated reaction energies and barriers for the (a), Mars-van Krevelen and the (b), Eley-Rideal mechanisms. (c), Adsorption geometries and energies of one CO molecule on Rh, one O<sub>2</sub> molecule adsored end-on( $\eta^1$ ) or side-on( $\eta^2$ ), two CO molecules or the co-adsorption of one CO and one O<sub>2</sub>( $\eta^1$ ) molecule. Those structures are representative for the adsorption modes on all the M<sub>1</sub>/CsPMA materials.

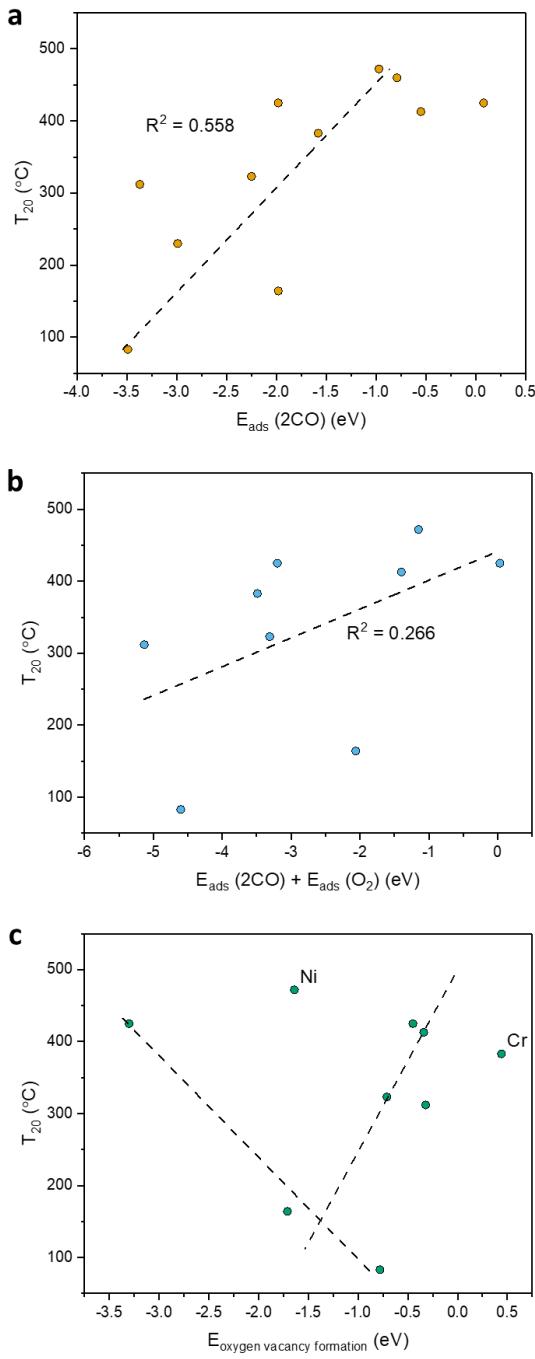

**Figure S26.** Trends for the adsorption and oxygen vacancy formation energies across the transition metals. Adsorption energies for one CO molecule (CO), two CO molecules (2CO), one CO<sub>2</sub> molecule (CO<sub>2</sub>), one O<sub>2</sub> molecule adsorbed side-on (O<sub>2s</sub>) or end-on (O<sub>2e</sub>) and the oxygen vacancy formation energies adjacent to the single-atom site for (a), 3d, (b), 4d, and (c), 5d transition metals.

General trends arise that enable us to categorize different TM SACs based on their adsorption properties. Groups 3-6 include metals that are very oxophilic with low CO adsorption energies and endothermic oxygen vacancy formation rendering them rather bad CO oxidation catalysts.

Group 7 and in particular Mn exhibit almost endothermic CO adsorption behaviour and thus are poor CO oxidation catalysts as well. Metals in group 8 adsorb the substrates strongly enough but do not have sufficiently large OV formation energies. Group 9 is located at an ideal point among the transition metals with ample adsorption energies for both CO and O<sub>2</sub> and moderate OV formation energies rendering them the most efficient CO oxidation SACs in our study. Groups 10-12, however, contain metals that mostly do not adsorb CO strongly enough and have very high OV formation energies potentially leading to the formation of thermodynamic sinks.

**Figure S27.** Trends for the adsorption energies of  $\text{O}_2$  on the metal site or into the oxygen vacant interface between the metal and the support. Adsorption energies are almost independent of the exact adsorption site for (a), 3d, (b), 4d, and (c), 5d metals.

**Figure S28.** Scaling relation between reaction energies the  $T_{20}$  values of different  $M_1/\text{CsPMA}$ . (a) Scaling relations between the adsorption energy of two CO molecules and the  $T_{20}$  values and (b) scaling relations between the sum of the adsorption energies of two CO molecules and one  $O_2$  molecules as well as the  $T_{20}$  values.  $R^2$  values of a linear fit are indicated at the graphs. (c) Scaling relations between the oxygen vacancy formation energy and the  $T_{20}$  values.
